Notes:

- 1 The above chart incorporated the new CFL peak values and have made slight adjustment to the Express CFL values. The net effect is a large reduction in realized peak demand savings. This is due to the finding that 7% of average daily residential CFL savings fall on the peak hour. CFL demand savings are reduced by approximately one-third from the previously calculated value in the DEER update.
- 2 No changes to HVAC measures in Express, SPC, SF Rebates, and MF Rebates have been made with the exception of the removal of programmable thermostat savings. Weather sensitive measure definitions, kWh savings, kW savings, therm savings, and measure costs will change when the DEER and Measure Cost study results become available.
- 3 Many of the non-residential measures shown above are averages across building types. The savings will remain consistent only if the same building type mix is realized. PG&E calculates savings on a building type specific basis reports information in summary format.
- 4 Not all non-weather sensitive measure savings values have been updated; only those that represent significant savings in 2004. Some of the CFL values have not been altered at this point in time.
- 5 Changes to savings values for the new construction programs are PG&E estimates for impacts upon the 2004 program efforts. The measure definitions (and associated kW, kWh, and therm savings) will likely change markedly f
