

We're here in Corcoran, middle of Central Valley, next to the Tulare Lake Basin, which was affected by the flood in late 2023. When the flooding happened, our distribution assets were at risk of flooding, so our substation equipment was removed.

Now we're here to build a capacity job at [INAUDIBLE] substation, which is going to fill in the gap for the capacity that we lost due to that equipment being removed. Essentially, we're adding 50 megawatt of capacity that allows us to fill the gap, plus add some more capacity to serve the future growth that we'll see in the future here in this area.

Our agricultural customers, they're the lifeblood for those that live and work in rural Fresno County, Tulare County, Kings County. And what we do here in the Central Valley is to support our customers.

Copy. We're ready to roll down here.

We're building our assets that they're in a lower flood risk area, and they're going to serve this community for the foreseeable future. And with the capacity that we're adding, we're able to serve the existing customers, plus bring on new Customers in the area, which will ultimately help the local economy.

We want our customers to know that the money they pay towards their bill, we are reinvesting it back into our communities to build safe, reliable, climate-resilient grid at the lowest cost possible.
