	VIBRATION DAMPER REQUIREMENTS FOR VARIOUS TYPES OF OVERHEAD CONDUCTORS	015073
Asset Type: Electric Transmission	Revision: Design, Estimating, and Planning	
Issued by: [REDACTED]	12-17-2020	
Rev. #05: This document replaces PG&E [REDACTED]	For a description of the changes, see Page 10.	

Purpose and Scope

This document illustrates the materials and installation data for protecting spans of conductor from fatigue damage due to aeolian vibrations.

1. The damper arrangements and spacings are intended for general use, on existing installations only.
2. Longer spans and conductor sizes not covered by this document should be referred to the transmission and distribution engineering personnel for assistance.
3. For new transmission lines, contact transmission line engineering personnel for damper arrangement and spacing requirements.
4. Every day tension (EDT) is the final conductor tension at the nominal temperature at 40° F, 0 lb wind for the design ruling span.
5. Dampers are to be installed on all spans longer than those shown in Table 1 on Page 2. The exception to this is low-tensioned lines where the EDT is less than 15% of the conductor ultimate (rated) strength and the line is **not** subjected to vibration producing winds. In general, dampers are not required in heavy loading areas or on lines where 715.5 kcmil aluminum is sagged according to [Document 015221](#), except for sections that may be exposed to winds as noted above. When dampers are installed on a section of low-tensioned lines due to wind exposure, install dampers in one additional adjacent span on each side of the exposed section. If a single span is exposed, a minimum of three spans should be dampened.
6. See Pages 9 and 10 for the application of dampers on #2 and #4 aluminum conductor steel reinforced (ACSR) conductors and 3 #6 and 7 #8 alumoweld overhead ground wires.
7. In general, dampers are not required on copper conductors. (See Page 10 for special application of dampers on copper conductors.)
8. In general, vibration dampers are not required for aluminum conductor steel supported (ACSS) type conductors. For special applications, refer to transmission line engineering personnel.

Vibration Damper Requirements for Various Types of Overhead Conductors

Damper Arrangement for Each Conductor or Sub-conductor

Notes

1. Suspension construction is shown. However, Figure 4, Figure 5, and Figure 6 also apply to pin and post-type construction.
2. In Figure 4, dampers may be installed at either end of the span.

Method A

Method B

Plan View

(for bundle conductor either method A or B may be used)

2,201 to 2,400	2,200	4,400						

Vibration Damper Requirements for Various Types of Overhead Conductors

Spiral-Type Vibration Dampers

Notes

1. At each end of the span, install one spiral damper per conductor on spans from 301 to 800 feet. Install two dampers per conductor on each end of spans 801 to 1,600 feet. Refer to transmission and distribution engineering personnel for assistance for spans shorter than 300 feet where conductor vibration is considered a problem. Install per Figure 7 and Figure 8.
2. No clamps or stoppers are required with spiral dampers since the pigtail portion of the damper is designed to grip the conductor.
3. Spiral-type vibration dampers are not placement sensitive. They may be placed on either side of a splice or a connector.
4. When the existing Stockbridge-type dampers, Alcoa catalog number 1701.4 fail, they are to be replaced with spiral-type dampers as shown in Table 6 on Page 10. Install one spiral damper per shield wire at each end of the span for spans up to 800 feet long, two spiral dampers at each end of the span for spans 801 to 1,600 feet, or three spiral dampers at each end of the span for spans 1,601 to 2,400 feet. Install per Figure 9.
5. When two dampers are required, they can be doubled up and installed as shown in Figure 10 rather than spread along the conductor as shown in Figure 9. A maximum of three dampers can be installed in a manner similar to that shown for two dampers in Figure 10.

Vibration Damper Requirements for Various Types of Overhead Conductors

Table 6 Spiral Vibration Dampers

Conductor and Shield Wire		Spiral Dampers		Code	Remarks (see notes)
		Manufacturer and Catalog Number

	7-#8	5050104			

Alcoa 1700 Series Dampers for Special Application for Copper Conductors

Notes

1. The spacing shown in Table 7 is for suspension, pin, or post-type construction. Install the damper adjacent to the end of armor rod or bypass connector (see [Document 058127](#)).
2. Before installing damper, clean the conductor and apply a liberal coating of oxide-inhibitor compound. In corrosion areas after damper installation, coat the damper clamp and conductor area adjacent to the clamp with oxide-inhibitor compound.

Table 7 1700 Series Dampers for Copper Conductors

Conductor Size AWG or kcmil	Catalog Number ¹	Code	Spacing (inches) See Note 1 and Page 2				Maximum Protectable Span (feet)	
			S1	S2	D1	D2	Figure 4 on Page 2	Figure 5 On Page 2
#2 – 7 Str.	AFL-1701-2 CU	188686	10	12	12	12	400	800
1/0 – 7 Str.	AFL-1701-3 CU	188646	12	12	14	12	500	1,000
2/0 – 7 Str.			14	13	16	13	600	1,200
3/0 – 7 Str.	AFL-1702-4 CU	188647	15	15	18	15	700	1,400
4/0 – 7 Str.			16-1/2	17	19-1/2	17	800	1,600
250 – 19 Str.	AFL-1702-5 CU	188687	18	18-1/2	21-1/2	18-1/2	900	1,800

¹ The CU suffix adds the bronze clamp to the dampers shown on Table 7.

Revision Notes

Revision 05 has the following changes:

1. Revised Table 7 on Page 10. Added two (2) columns “S1” and “S2”.
2. Revised typos inside tables. “ALF” was changed to “AFL”
3. Changed document owner from [REDACTED] to [REDACTED]
