* Revised May 11, 2009 pursuant to CPUC Decision 09-04-034.

- Interested parties are hereby notified that PG&E reserves all its available rights and remedies to obtain a revision to this posting retroactive to January 1, 2009.
- This Capacity Value is the combustion turbine proxy capacity value effective beginning April 1, 1997, as approved in CPUC Decision 97-03-017 on March 7, 1997. This value has been adjusted for use in 2009 to reflect inflation. A weighted average of the capacity value is used for meters without time-of-delivery metering.
- Capacity allocation factors (CAF) allocate the capacity value for seasons and time-of-delivery periods. These factors are derived by dividing the allocation percentages effective January 1, 2009, and approved in D. 97-03-017 by the number of hours in each time-of-delivery period. These percentages and hours are summarized, as follows:

	CAFs (%)		2009 Delivery Hours	
	Period A	Period B	Period A	Period B
Peak	76.19%	N/A	774	0
Partial-Peak	2.38%	21.25%	903	1625
Off-Peak	0.02%	0.15%	2003	1995
Super-Off-Peak	N/A	N/A	736	724
Season total	78.59%	21.41%	4416	4344

Example of year/hr CAF for "Period A - Peak:"
76.19% divided by 774 hours = 0.0009844

- Capacity prices are adjusted for the effect of deliveries on PG&E's transmission and distribution losses based upon the seller's interconnection voltage level. The loss adjustment factors for non-remote facilities (as defined by the CPUC) are shown here.
- The as-delivered capacity price is the product of three factors: capacity value, allocation factor, and capacity loss adjustment factor.
