

Fact Sheet – June 2015

Introduction

Last year, Pacific Gas and Electric Company (PG&E) completed a five-month environmental remediation project at 1301 Mitchell Drive in St. Helena. In June 2015, PG&E will be relocating groundwater monitoring wells and conducting post-remediation sampling to confirm that cleanup goals were achieved. This work is being performed voluntarily as part of PG&E's company-wide program to cleanup former manufactured gas plant (MGP) sites and is overseen by the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC).

What work is planned?

Work will take place between the hours of 7 a.m. to 5 p.m., Monday through Friday, and will include:

- Removing six existing wells and installing ten new groundwater monitoring wells on-site, in the Umpqua Bank parking lot and at an additional off-site property using a truck-mounted drill rig;
- Collecting groundwater samples from new groundwater wells; and
- Conducting general cleanup of work areas.

A drill rig (left) will be used to install new wells.

Will there be any off-site impacts?

PG&E will work closely with off-site properties and the City of St. Helena to conduct this work and limits off-site impacts to the greatest extent possible. Crews will use two to three parking spaces while working in the Umpqua Bank parking lot. Any noise will be from the engine of the truck and will stay well within levels allowed by the City of St. Helena. There will be no street closures or other impacts to nearby streets.
